## Brandt's New Tension Hydrotester Improves Performance and Reliability

**Regina, Saskatchewan November 14, 2011-** Brandt Engineered Products Ltd. introduces significant improvements to the Tension Hydrotester to increase performance, reliability, ease of maintenance and operator comfort.

**Productivity** is increased by doubling the hydraulic flow to the pressure intensification system. Higher flow vertical turbine pumps providing up to 1200 GPM, and a 180% larger air purge valve results in less back pressure and reduced filling time. Faster changeover times occur through the use of an intermediate connection from water supply piping to tooling.

**Reliability** is improved with the use of steel hard lines for hydraulic and high pressure water systems, and more robust support cart hydraulic valves that are remotely set from the operator's booth. A sacrificial adapter was added to tooling to prevent damage to the main housing from connection of the high pressure water hose.

**Ease of Maintenance** is achieved by reducing the amount of grease points through the use of composite materials, and easy adjustment of pipe flush out nozzles with no tools required.

**Operator Comfort** is enhanced with a new state of the art, sound insulated, climate controlled operator's booth. The main control panel is housed inside the booth as well, for ease of maintenance and troubleshooting. Improved headstock actuation linkage and increased lighting inside the truss improves visibility, and an optional camera system is available for viewing entry/exit and tailstock sections.

Brandt Engineered Products Ltd. specializes in machine and system design, manufacturing, installation, and commissioning for the Tube & Pipe and Mining industries and has been providing Finishing Floor Solutions for over 20 years.
